Welcome to the WSO2 Enterprise Service Bus (ESB) Connectors documentation! A connector allows you to interact with a third-party product's functionality and data from your ESB message flow, enabling you to connect to and interact with the APIs of services such as Twitter, Salesforce, and JIRA. This means that if you have enabled the Twitter and Google Spreadsheet connectors in your ESB instance, your message flow could receive requests containing a user's Twitter name and password, log into the user's Twitter account, get a list of the user's followers, and write that information to a Google spreadsheet. You can use one or more connectors in order to manage generic use cases related to a business scenario that you may need to address.

The following topics provide more information on connectors and the use of connectors in managing various business scenarios:

- WSO2 ESB Connectors
- Sample Business Scenarios
- Tutorials
- Business Solutions
- Best Practices
- FAQs

Click a link on the left to view the documentation for that connector. To browse the available ESB connectors, go to the WSO2 Store.
