Managing Alerts

WSO2 API Cloud supports various alert types to monitor API-related statistics for different purposes. Some of the common scenarios that require alerts include a sudden failure of one or more APIs, a sudden increase in the response time of one or more APIs, a change in the pattern of API resource access etc.

The following topics describe the different alert types that WSO2 API Cloud supports, and also provides details on how you can configure and subscribe to the alert types that you want to have.
